

Natural history of Charcot-Marie-Tooth disease type 1A: a longitudinal cohort study

Abstract: We report five-year longitudinal outcomes in a cohort of 120 patients with genetically confirmed CMT1A. Disease progression was measured using the CMTNS. Patients showed a mean annual decline of 0.4 points on the CMTNS scale, with substantial inter-patient variability. PMP22 duplication was confirmed in all cases.

This full-text PDF was generated as a test fixture and contains genuinely extractable text content, unlike a synthetic byte string, so extraction tests exercise the real pypdf code path end to end.
